

Project 5 – SOC & SIEM

02 – Log Collection Evidence

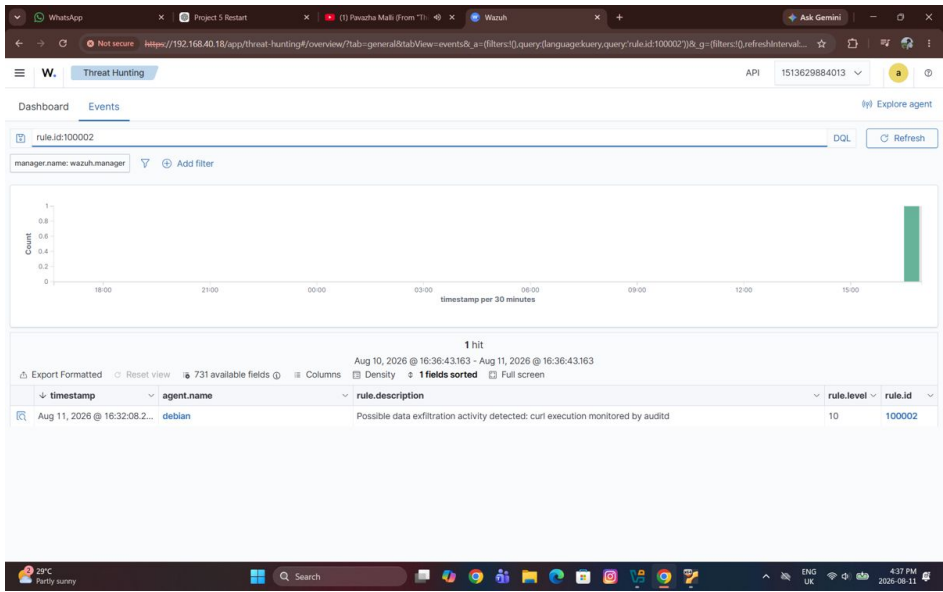

Evidence demonstrating centralized collection, indexing, filtering, and investigation of Linux and Windows security events in Wazuh.

Evidence 1: Screenshot 15

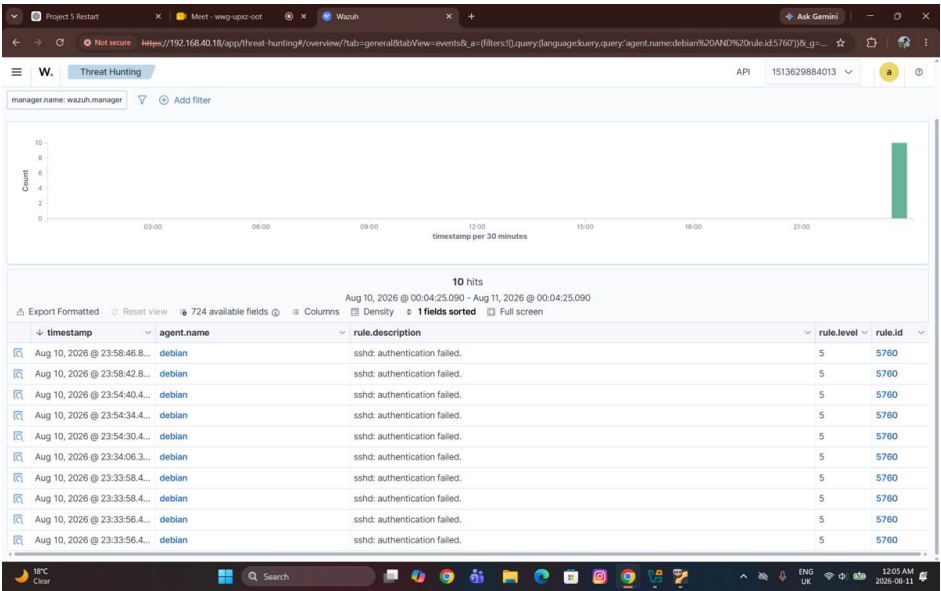

Wazuh Threat Hunting view showing normalized event records from the monitored environment, confirming that endpoint activity is being collected and indexed for investigation.

Evidence 2: Screenshot 16

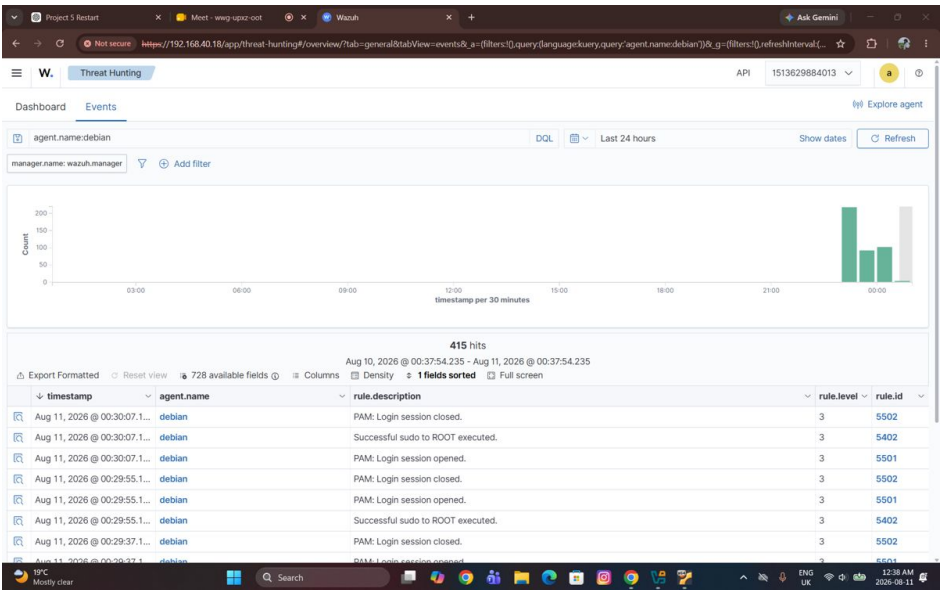

Wazuh event view filtered to a specific rule identifier, demonstrating that collected security events can be isolated and reviewed using rule-based filtering.

Evidence 3: Screenshot 17

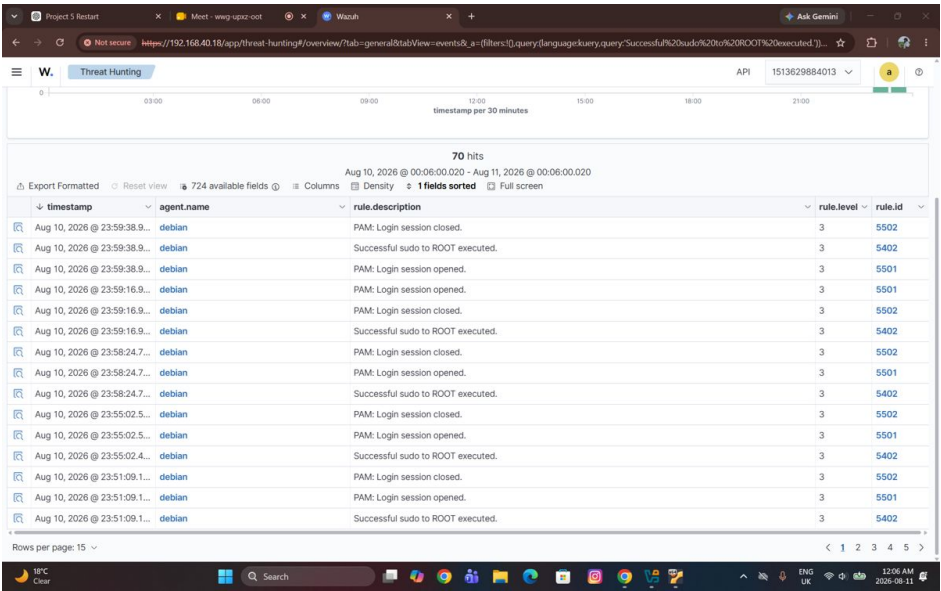

Wazuh records showing repeated SSH authentication failures from the Debian endpoint. The events demonstrate successful collection of Linux authentication activity into the SIEM.

Evidence 4: Screenshot 18

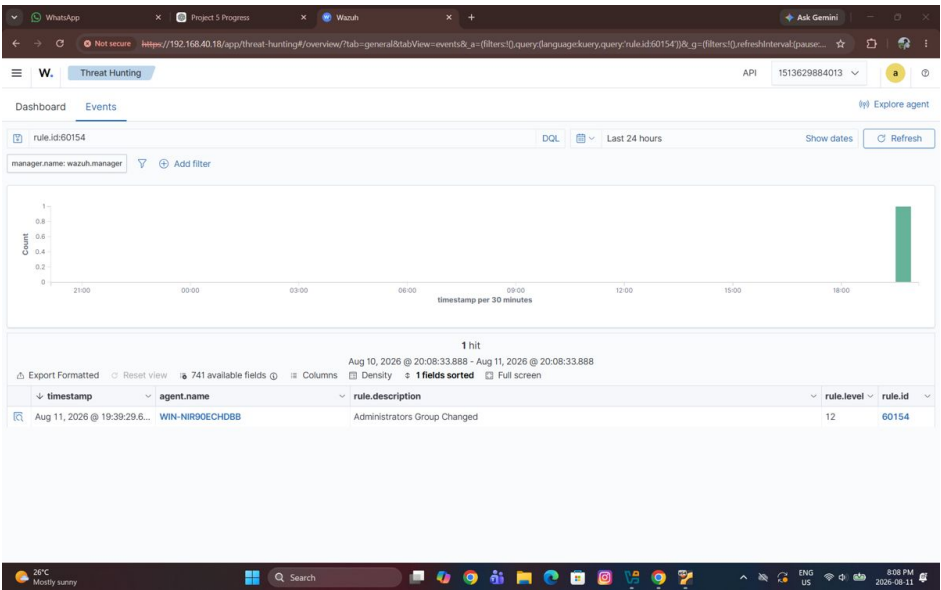

Wazuh event results filtered to the Debian agent, confirming that endpoint-specific events can be retrieved and analyzed from the centralized SIEM.

Evidence 5: Screenshot 19

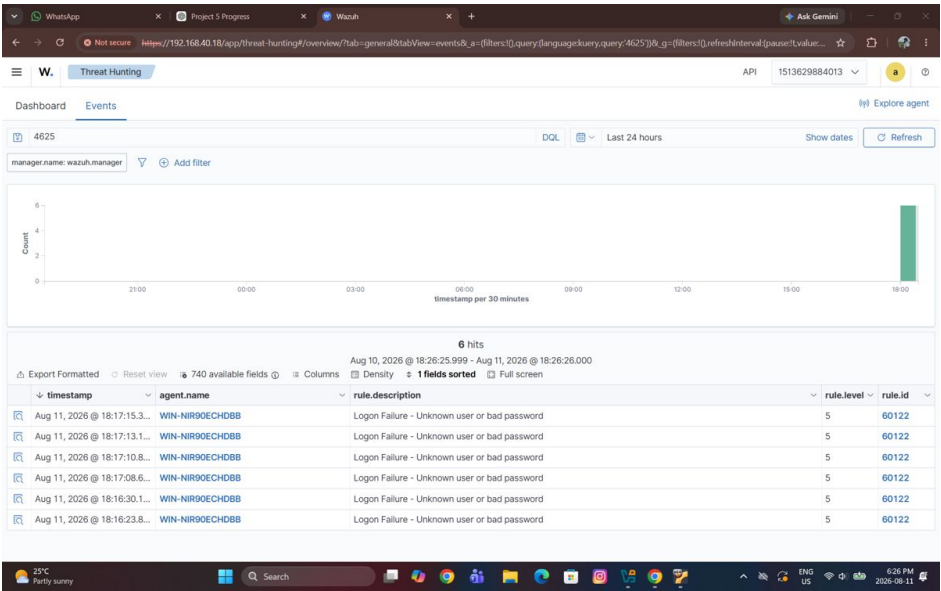

Wazuh events showing PAM session activity and successful sudo-to-root events from Debian. This demonstrates collection of Linux authentication and privilege-related logs.

Evidence 6: Screenshot 20

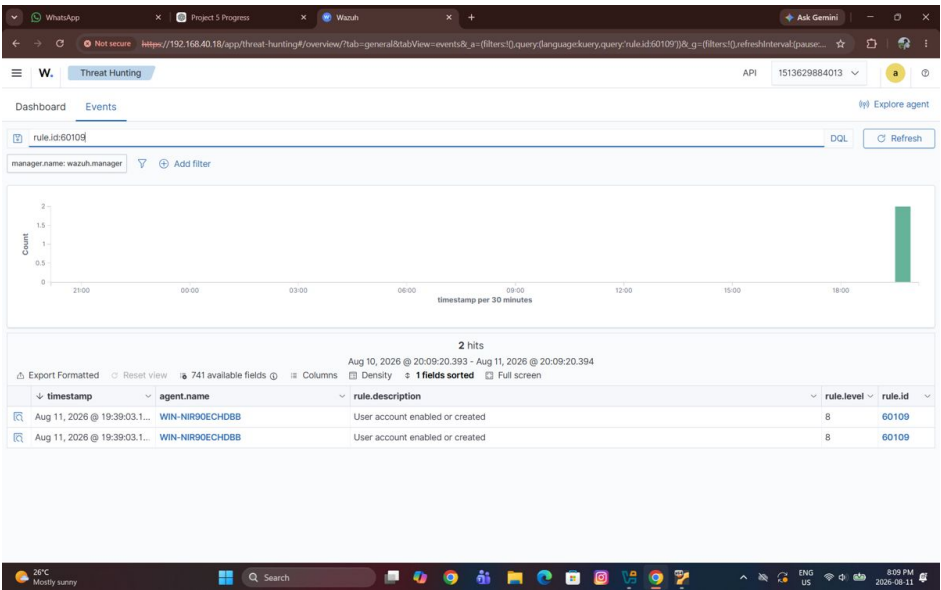

Wazuh Threat Hunting event view showing collected events over a defined time range, demonstrating centralized visibility and time-based log analysis.

Evidence 7: Screenshot 21

Wazuh events for Windows Event ID 4625, representing failed Windows logon attempts. This confirms Windows security events are being ingested and searchable in the SIEM.

Evidence 8: Screenshot 22

Wazuh Threat Hunting view filtered by a specific rule ID, demonstrating normalized event data and the ability to investigate individual detection events.
